

1	The program starts
2	A variable to convert USD to Euros is created
3	A variable to convert USD to Yen is created
4	The program prompts the user to input what they want USD to be converted to
5	The program analyzes whether the user asked for the conversion variable to Euros or Yen, and creates a variable for the response
6	The program prompts the user to input the monetary value in USD that they would like converted to Euros/Yen
7	The program analyzes what monetary quantity the user input.
8	The program checks if the user input "Euros" for the variable "userResponse"
9	If so the program converts USD to Euros
10	And proceeds to display the result
11	If the user did not input "Euros" for the variable "userResponse"
12	The program converts USD to Yen
13	And proceeds to display the result
14	Then the program ends
